TAMBORA

NOVEMBER 2026

Our MVP Site.

The full site launches at the end of 2026.

Tambora builds autonomous drones, the docks they live in and the AI that flies them. We start with security in South Africa, with one simple aircraft and a clear focus on getting the AI and the data right. The later steps move into medical and heavy-load aviation, and eventually vehicles that fly.

Phase one aircraft, technical drawing.

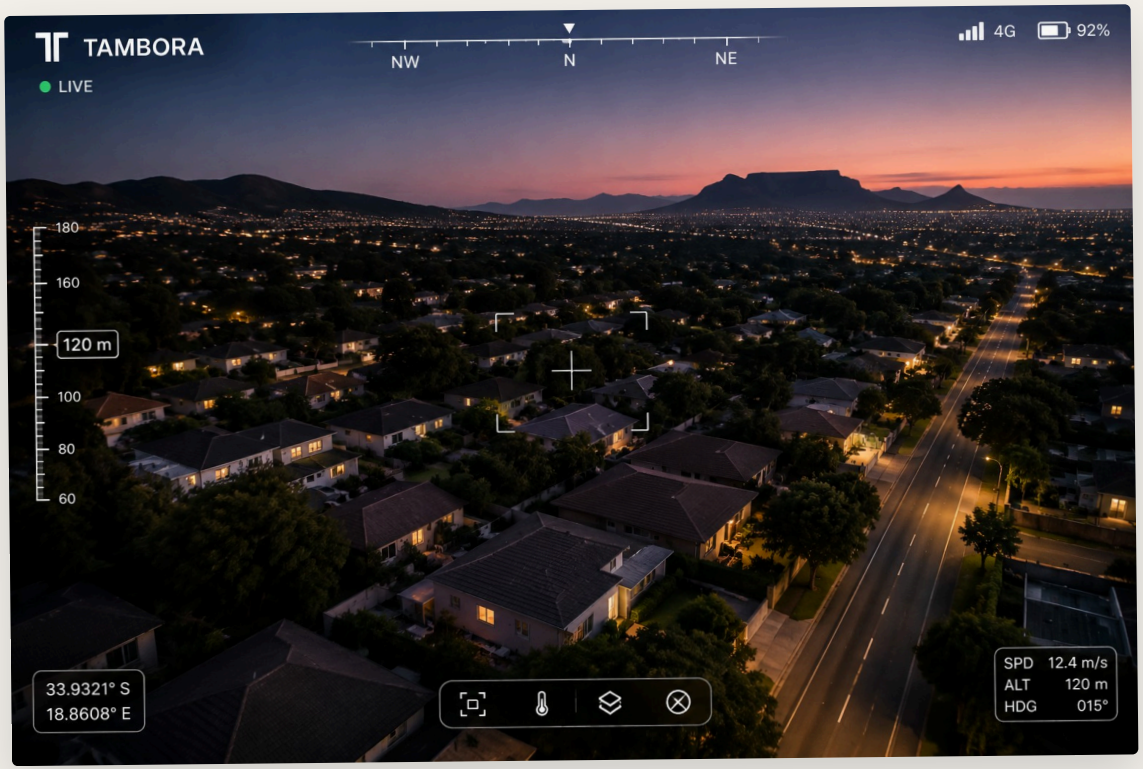

Built in	First market	Next
South Africa	Security	Medical, then firefighting

One company. **Built in increments.**

Tambora is the parent company. It owns the technology, the AI and the team.

Every step of the business runs on the same aircraft, docks and software, so each new mission starts with everything the last one proved.

> Most autonomy is built for consumers. **Ours is built for the services that protect them.**

Concept: the operator's view on a phase one patrol, Stellenbosch at dusk.

From simple **to complex.**

We start with the simplest aircraft and the simplest job, then move up one step at a time. Each version flies before the next one is built.

01

Security

● **In action now**

Drones launch from docks on site, patrol day and night, and alert response teams quickly.

02

Medical

Next

Heavy-load delivery of blood, medicine and equipment between hospitals and clinics.

03

Firefighting

Later

Heavy-lift aircraft that help detect, map and fight wildfires.

And after that: heavy-load aviation, and one day, vehicles that fly.

Every flight starts **on the bench.**

Sagwic is Tambora's research lab. It designs and builds the docks, and develops the AI layer on open-source models. Everything Tambora flies is worked out here first.

- → docks that swap batteries by themselves
- → batteries that last longer in the heat
- → autonomy you don't have to pilot
- → payloads that get heavier every version

What's next. **The year ahead.**

Mostly software first, with early hardware tested alongside it. This page will be updated as each step is reached.

2026

Building the first autonomous MVPs

The first aircraft, dock and AI working together, in security.

END OF 2026

The full flytambora.com launches

The complete story: the company, the platform and every phase.

JANUARY 2027

First advisory board finalised

Advisors in place for the next stage of growth.

2027

Software first, early hardware tests

Mainly AI and platform development, with hardware trials alongside.
