TAMBORA

NOVEMBER 2026

Our MVP Site.

The full site launches at the end of 2026.

Tambora builds autonomous drones, the docks they live in and the AI that flies them. We start with security in South Africa, with one simple aircraft and a clear focus on getting the AI and the data right. The later steps move into medical and heavy-load aviation, and eventually vehicles that fly.

Phase one aircraft, technical drawing.

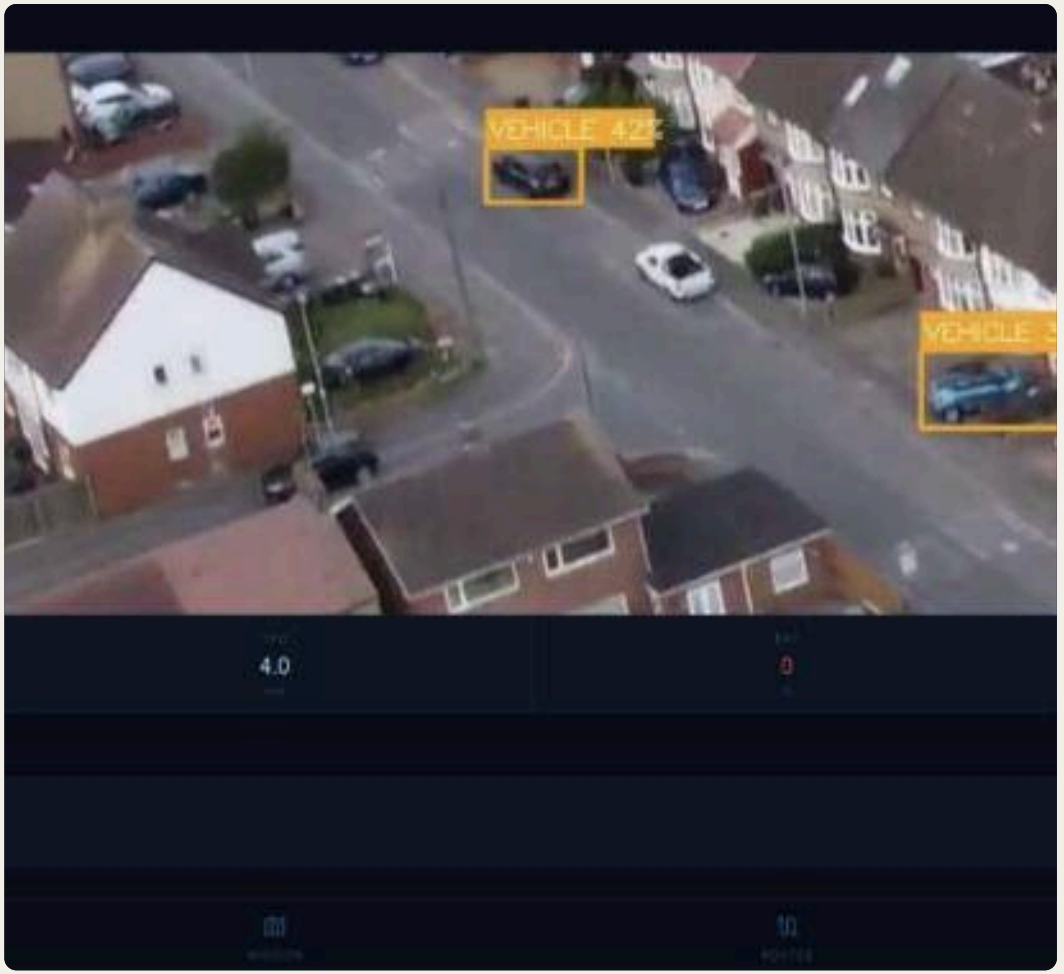

Built in	First market	Next
South Africa	Security	Medical, then firefighting

One company, one mission. **Built in increments.**

Tambora is the parent company. It owns the technology, the AI and the team, and every phase of the business runs on the same platform.

That matters for one reason: each new mission starts with everything the last one proved. The aircraft, the docks and the software that work for security become the starting point for medical flight, and then for firefighting.

01	**Aircraft**	A simple first airframe, growing to heavy-lift.
02	**Docks**	Where the aircraft launch, land, charge and wait.
03	**Autonomy and AI**	Flies the route and decides when a person is needed.
04	**Research**	The hard problems: docks, batteries, autonomy, payload.

Phase one software during a patrol: the aircraft flags vehicles on the ground and reports altitude, speed and battery to the operator.

THE DIFFERENCE

Most autonomy is built for consumers. **Ours is built for the services that protect them**, public and private.

From simple **to complex.**

Development moves from the simplest airframe to the most complex through flight-validated versions. Each one adds payload and autonomy, and each new phase takes the platform into a harder sector.

THE AIRFRAME

v1 — v2 — v3 — v4 — **Heavy-load**

- **Research and AI, always on.** Designs the docks and builds the AI layer on open-source models, for every phase.

01

Security • IN ACTION

Autonomous drones launch from docks on site, patrol day and night, and alert response teams quickly.

FOR

Security companies, estates, mines, farms, municipalities.

02

Medical NEXT

Heavy-load medical delivery: blood, medicine and equipment between facilities, then emergency response.

FOR

Hospitals, clinics, laboratories, health departments.

03

Firefighting LATER

Heavy-lift aircraft that detect, map and help suppress wildfires, alongside crews on the ground.

FOR

Fire services, forestry, agriculture.

THE GOAL Heavy-load aviation, and eventually vehicles that fly.

What's next. **The year ahead.**

Mostly software first, with early hardware tested alongside it. This page will be updated as each step is reached.

2026

Building the first autonomous MVPs

The first aircraft, dock and AI working together, in security.

END OF 2026

The full flytambora.com launches

The complete story: the company, the platform and every phase.

JANUARY 2027

First advisory board finalised

Advisors in place for the next stage of growth.

2027

Software first, early hardware tests

Mainly AI and platform development, with hardware trials alongside.
